

If you're not using Biostacked HiStick N/T, what are you leaving on the table?

HiStick® N/T

The Biostacked® Inoculant

Let's put the facts on the table.

Biostacked® soybean inoculants really add up. With HiStick® N/T you get a wide range of features that deliver serious bottom-line benefits.

-  **More rhizobia...**
Nothing's better than a Biostacked inoculant to kick a soybean crop into high gear. With HiStick N/T Liquid you get three billion nitrogen-fixing rhizobia per gram. That's 50% more *B. japonicum* than any other commercial soybean inoculant.
-  **... long-lasting on-seed power**
Biostacked inoculants last longer, pure and simple. The rhizobia in HiStick N/T Liquid + Extender survive 30 days on untreated seed.
-  **... another beneficial biological**
Most inoculants end there – with just one biological. Not Biostacked inoculants. With HiStick N/T you get a second biological, *B. subtilis*. It delivers enhanced nitrogen fixation by significantly increasing plant vigour, root mass and nodule formation. And it's available in a full portfolio of Biostacked inoculant formulations.
-  **... greater plant vigour**
Biostacked inoculants charge out of the gate. Crop canopy closes up to five days earlier with the Nodulating Trigger® technology in Biostacked HiStick N/T inoculant. And research shows a 206% increase in nodule weight when compared to no inoculant. Greater plant vigour, greater root biomass and more nitrogen-fixing nodules. Now that's return on investment!
-  **And ultimately... MORE YIELD.**
Best of all, research conducted by the University of Guelph shows 1.5 to 1.8 bu/ac yield (4 to 6%) increase when compared to non-Biostacked inoculants. Increased performance, superior return on investment and most importantly, added yield potential... it all adds up!

The facts keep adding up to the same bottom line:

If it's Biostacked, it really stacks up.
